1. Introduction

Back then in 2016 I was playing with numbers and have noticed the pattern in terms of finite differences of cubes n^3 . Considering the table of forward finite differences of the polynomial n^3

n	n^3	$\Delta(n^3)$	$\Delta^2(n^3)$	$\Delta^3(n^3)$
0	0	1	6	6
1	1	7	12	6
2	8	19	18	6
3	27	37	24	6
4	64	61	30	6
5	125	91	36	
6	216	127		
7	343			

Table 1. Table of finite differences of the polynomial n^3 .

Date: July 14, 2023.

²⁰¹⁰ Mathematics Subject Classification. 26E70, 05A30.

Key words and phrases. Binomial theorem, Polynomial identities, Binomial coefficients, Bernoulli numbers, Pascal's triangle, Faulhaber's formula.

We can observe easily that finite differences of the polynomial n^3 may be expressed according to the following relation, via rearrangement of the terms

$$\Delta(0^3) = 1 + 6 \cdot 0$$

$$\Delta(1^3) = 1 + 6 \cdot 0 + 6 \cdot 1$$

$$\Delta(2^3) = 1 + 6 \cdot 0 + 6 \cdot 1 + 6 \cdot 2$$

$$\Delta(3^3) = 1 + 6 \cdot 0 + 6 \cdot 1 + 6 \cdot 2 + 6 \cdot 3$$

$$\vdots$$

$$\Delta(n^3) = 1 + 6 \cdot 0 + 6 \cdot 1 + 6 \cdot 2 + 6 \cdot 3 + \dots + 6 \cdot n$$

Furthermore, the polynomial n^3 is identical to

$$n^{3} = [1 + 6 \cdot 0] + [1 + 6 \cdot 0 + 6 \cdot 1] + [1 + 6 \cdot 0 + 6 \cdot 1 + 6 \cdot 2] + \cdots$$
$$+ [1 + 6 \cdot 0 + 6 \cdot 1 + 6 \cdot 2 + \cdots + 6 \cdot (n - 1)]$$

Rearranging above equation we get

$$n^{3} = n + (n-0) \cdot 6 \cdot 0 + (n-1) \cdot 6 \cdot 1 + (n-2) \cdot 6 \cdot 2 + \dots + 1 \cdot 6 \cdot (n-1)$$

Therefore, we can consider n^3 as

$$n^{3} = \sum_{k=1}^{n} 6k(n-k) + 1 \tag{1.1}$$

Assume that equation (1.1) has an implicit form as follows

$$n^{3} = \sum_{k=1}^{n} \mathbf{A}_{1,1} k^{1} (n-k)^{1} + \mathbf{A}_{1,0} k^{0} (n-k)^{0},$$
(1.2)

where $\mathbf{A}_{1,1} = 6$ and $\mathbf{A}_{1,0} = 1$, respectively. So could the relation (1.2) be generalised for all positive odd powers? Therefore, let be a conjecture

Conjecture 1.1. For every $n \geq 1$, $n, m \in \mathbb{N}$ there are coefficients $\mathbf{A}_{m,0}, \mathbf{A}_{m,1}, \dots, \mathbf{A}_{m,m}$ such that

$$n^{2m+1} = \sum_{k=1}^{n} \mathbf{A}_{m,0} k^{0} (n-k)^{0} + \mathbf{A}_{m,1} (n-k)^{1} + \dots + \mathbf{A}_{m,m} k^{m} (n-k)^{m}$$
